TheraT: Transforming Kidney Health

Improving the lives of CKD patients through gastro-intestinal modulation

THERA T

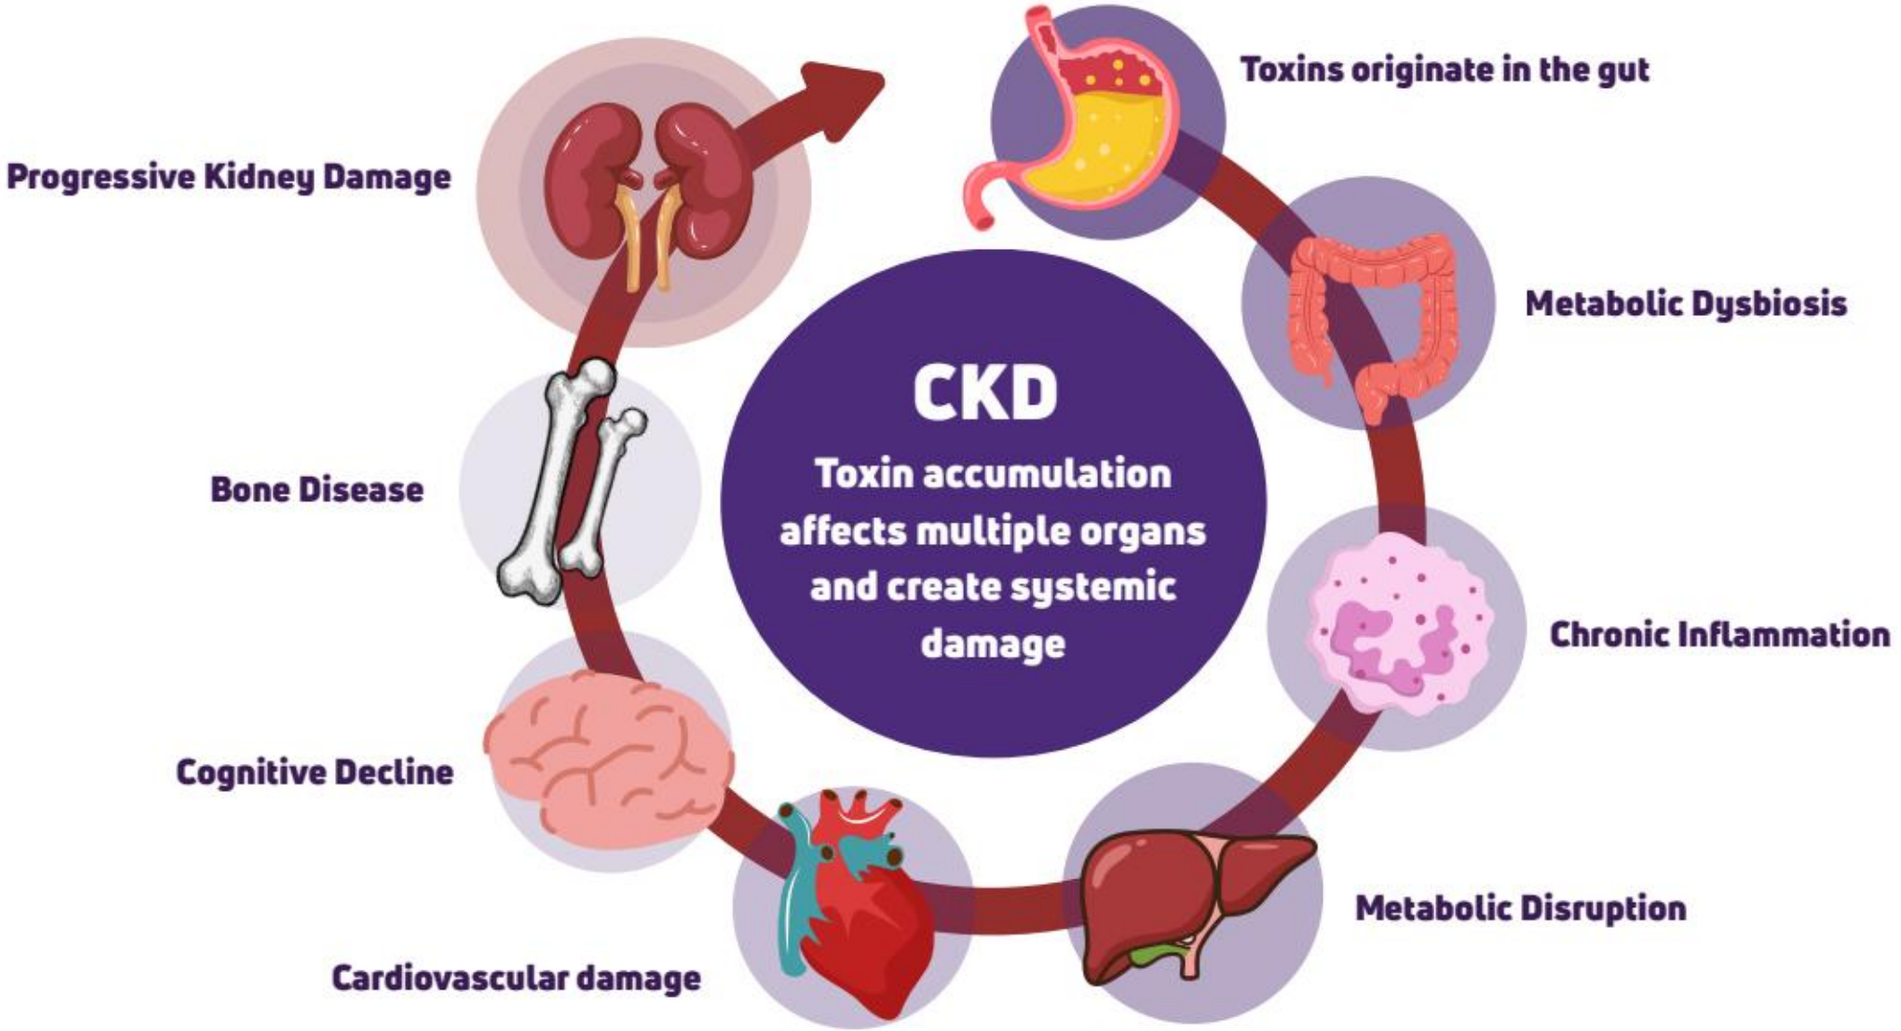

850M people live with Chronic Kidney Disease

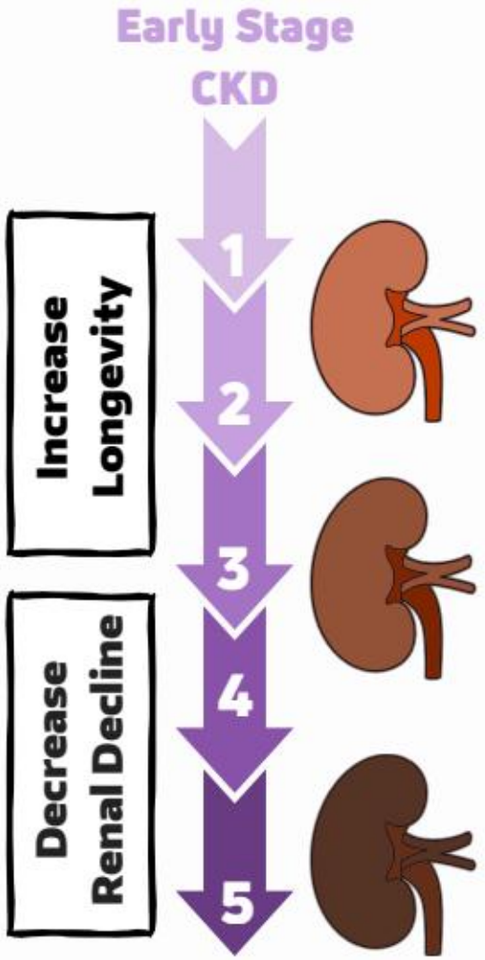

Dialysis costs 1% of the government budget (~60B/year)

Toxin accumulation is a downstream consequence that compounds the disease

TheraT could improve health outcomes for patients

- Lower systemic toxin accumulation
- Slow progression of kidney disfunction
- Extend transplant lifespan
- Slow progression on secondary disease burden
- Reduce dialysis frequency or session duration

CKD=Chronic Kidney Disease
